Professional Summary

- Around 11 years of hands-on experience as a **Business Analyst with Healthcare**, I bring a track record of success in comprehending business requirements, conducting data analysis, orchestrating ETL processes, crafting data models, and spearheading design and development efforts.
- Conducted in-depth analysis of **Medicare and Medicaid claims data** to identify patterns, trends, and cost drivers within these healthcare programs.
- Ensured data analysis and reporting activities strictly adhered to **Medicare and Medicaid regulations**, including compliance with CMS (Centers for Medicare & Medicaid Services) guidelines.
- Analyzed the effects of **Medicaid expansion** on enrollment, healthcare access, and costs, providing insights for policymakers and stakeholders.
- Proficient in extracting and transforming data from **Epic databases**, including Clarity, Chronicles, and Caboodle, for analysis and reporting.
- Developed and maintained policies and procedures to ensure the secure handling, storage, and transmission of **PHI**, adhering to **HIPAA** and other relevant regulations.
- Successfully executed **Agile methodologies** such as Scrum and Kanban, managing **sprint planning, backlog grooming**, and daily stand-up meetings to ensure timely delivery of data analysis tasks.
- Conducted iterative data analysis cycles within **Agile sprints**, providing stakeholders with incremental insights and maintaining flexibility to accommodate changing requirements.
- Developed comprehensive project plans, timelines, and resource allocation strategies in adherence to the **Waterfall methodology**, ensuring that healthcare data analysis projects were well-structured and organized.
- Managed data analysis projects through structured phases, including requirement analysis, data collection, data cleansing, data transformation, analysis, and reporting, following **Waterfall principles**.
- Proficient in collaborating with healthcare stakeholders to develop comprehensive **BRDs**, capturing their data and analytics needs to improve patient care and operational efficiency.
- Created use cases based on **FRDs** to provide clear, detailed scenarios for data system functionality, facilitating communication between business and IT teams.
- Developed **NFRDs** to address critical aspects of healthcare data systems, such as data security, performance, scalability, and compliance with healthcare regulations.
- Developed **data mapping specifications** to define how data should be transformed, cleansed, and integrated from source systems to target systems.
- Conducted **post-migration audits** to verify that migrated data met predefined quality standards and satisfied healthcare regulatory requirements.
- Proficient in writing complex **SQL queries** to extract data from **healthcare databases**, including electronic health records (EHR) and claims databases.
- Developed **SQL scripts** to validate healthcare data, identify anomalies, and enforce data quality standards, ensuring reliable analysis results.
- Analyzed patient demographics using **SQL** to identify trends, such as patient age distribution and gender disparities, assisting in resource allocation and marketing strategies.
- Optimized **Power BI reports** for efficient data loading and responsiveness, ensuring seamless user experiences even with large datasets.

- Designed and implemented **Key Performance Indicator (KPI)** tracking dashboards in **Power BI** to monitor healthcare facility performance, such as patient wait times and readmission rates.
- Developed complex calculations and custom functions in **Tableau** to address specific healthcare metrics and requirements, such as risk stratification models.
- Designed dynamic and interactive **Tableau dashboards** that allow users to explore healthcare data from various angles and dimensions.

- **TECHNICAL SKILLS**

Visualization tools	Tableau Desktop, Power BI Desktop.
Computer skills	Microsoft office, Google docs, spreadsheets
Data modeling	Star and snowflake
Languages	Python, R, SQL, SAS, XML
Cloud services skills	AWS, GCP(Google cloud platform), Microsoft Azure and data bricks
Tools	Git, Jira, Informatica
Databases	ORACLE, MS Access, MY SQL, SQL server
Operating systems	Windows, Linux, Mac OS ,UNIX and DB2

Experience

**Centene
Chicago, IL**

Senior Business Analyst

Project Name: Vaccine Distribution Optimization

Feb 2020- till date

- Developed strategic plans for **vaccine distribution optimization**, considering factors like vaccine supply, demand forecasting, and geographic distribution.
- Led cross-functional teams responsible for **vaccine distribution**, ensuring clear communication and alignment with distribution objectives.
- Developed contingency plans for rapid **vaccine distribution** in emergency situations, such as pandemics or disease outbreaks.
- Conducted training sessions for distribution staff to ensure compliance with best practices and safety standards.
- Led a cross-functional team of [number of team members] in the analysis, design, and implementation phases of a vaccine distribution optimization project using the **Waterfall SDLC methodology**.
- Managed project resources, budgets, and timelines to ensure adherence to the **Waterfall methodology's** sequential phases.
- Successfully deployed the **vaccine distribution optimization** software, providing training to end-users and healthcare personnel.
- Developed a comprehensive **functional requirements document (FRD)** outlining the end-to-end vaccine distribution process, including data capture, order processing, inventory management, and reporting.
- Defined and enforced performance benchmarks and **non-functional requirements**, ensuring system scalability and responsiveness to handle peak vaccination periods.

- Developed a **BRD** that outlined the return on investment (ROI) for implementing advanced **vaccine distribution optimization** strategies, demonstrating cost savings.
- Designed **data models and schemas** for a centralized data repository that facilitated real-time analytics and reporting on vaccine inventory levels, demand forecasts, and distribution performance.
- Collaborated with data engineers to develop **ETL** (Extract, Transform, Load) processes, ensuring seamless data integration between disparate systems and data sources.
- Implemented **Tableau dashboards** to monitor vaccine inventory levels, distribution routes, and vaccination rates across multiple locations.
- Implemented geospatial analytics in **Tableau** to visualize vaccine distribution heatmaps, aiding in the identification of high-priority areas.
- Collaborated with cross-functional teams to integrate data from various sources into **Tableau**, ensuring data accuracy and completeness.
- Utilized **Tableau** to create daily, weekly, and monthly vaccine distribution reports for clients, enhancing transparency and data-driven decision-making.
- Utilized **SQL scripts** to extract daily vaccine shipment records from CSV files and transformed them into a normalized database schema.
- Conducted **SQL queries** to identify and rectify missing or inconsistent data entries, improving data integrity.
- Developed an **SQL algorithm** that considered factors like population density, cold storage capacity, and transportation times to **optimize vaccine distribution** routes.
- Implemented **SQL checks** to monitor and alert staff when vaccine storage temperatures deviated from acceptable ranges.

Elevance Health

Grand Prairie, TX

Senior Business Analyst

Project Name: Mortality Rate Analysis

March 2018- Jan 2020

- Provided actionable recommendations to medical teams for improving patient outcomes and reducing **mortality rates**.
- Utilized historical **mortality data** to identify patterns and variations across different time periods and demographics.
- Integrated diverse data sources, including electronic health records, public health databases, and vital statistics, to build comprehensive **mortality datasets**.
- Collaborated with healthcare professionals, epidemiologists, statisticians, and public health experts to ensure the accuracy.
- Actively participated in sprint planning meetings to define **user stories**, prioritize tasks, and estimate project timelines.
- Employed **Agile principles**, including daily stand-up meetings, **sprint planning**, and continuous collaboration, to ensure the project's flexibility and responsiveness to changing requirements.
- Collaborated with cross-functional teams, including **healthcare providers, data scientists, and IT professionals**, to define user stories, prioritize tasks, and ensure alignment with the project's objectives.
- Worked closely with healthcare professionals to create **user stories** that captured the specific analysis and reporting requirements related to **mortality rate trends**.
- Developed detailed **UAT test plans**, test cases, and scripts based on user stories and business requirements.

- Executed **UAT test cases**, identifying and documenting defects and issues in the mortality rate analysis dashboard.
- Identified and documented all relevant data sources, including patient records, demographics, medical history, and **mortality-related information**.
- Documented the **relationships and dependencies** between different data elements, facilitating the understanding of data flow and logic.
- Designed **aggregation methods** to calculate mortality rates at various levels, such as regional, demographic, or disease-specific.
- Developed interactive and visually appealing **Power BI dashboards** to track and analyze mortality rates in healthcare settings.
- Utilized **DAX (Data Analysis Expressions)** to create custom measures and calculations, allowing for in-depth mortality rate analysis, trend identification, and risk assessment.
- Developed **KPIs and performance metrics** within **Power BI** to measure mortality rate improvements, providing actionable insights for healthcare management.
- Integrated alerting mechanisms in **Power BI** to notify healthcare teams of sudden spikes or unusual patterns in mortality rates, facilitating timely responses.
- Utilized **SQL queries** to extract and analyze mortality data from large healthcare databases, identifying trends and patterns over time.
- Employed **SQL** to identify and quantify risk factors contributing to high mortality rates, providing actionable insights for healthcare decision-makers.
- Conducted **SQL-based comparative analysis** of mortality rates across different geographic regions, healthcare facilities, or patient populations.
- Maintained detailed **documentation of SQL queries**, data sources, and methodologies used in mortality rate analysis for transparency and reproducibility.

Novavax Pharma
Gaithersburg, Maryland
Business Analyst

Project Name: Health Insurance Claims Analysis

Feb 2016- March 2018

- Processed and evaluated a high volume of **health insurance claims**, including medical, dental, and vision, ensuring adherence to policy terms and regulatory guidelines.
- Conducted thorough reviews of **complex claims**, investigating discrepancies, and resolving issues to minimize financial risks and maintain customer satisfaction.
- Proficient in **medical coding systems** (ICD-10, CPT, HCPCS) to accurately classify diagnoses, procedures, and services for proper **claim adjudication**.
- Proficient in utilizing data analysis tools and software to uncover patterns, trends, and anomalies in **claims data**, resulting in improved **claims processing efficiency**.
- Led a cross-functional **Agile team** in analyzing health insurance **claims data** to identify cost-saving opportunities and improve claims processing efficiency.
- Translated business requirements into **user stories and prioritized** them within the **Agile backlog**.
- Applied **Agile principles** and practices to the claims analysis project, promoting collaboration, transparency, and adaptability.

- Developed a comprehensive **Business Requirements Document (BRD)** in collaboration with stakeholders to outline project objectives, scope, and success criteria.
- Maintained and updated the **BRD** to accommodate changing business needs and regulatory requirements throughout the project lifecycle.
- Developed **validation rules and scripts** to detect inconsistencies, anomalies, and errors in incoming insurance **claims data**.
- Implemented **automated data validation** checks to proactively identify and address data anomalies, reducing manual error checking efforts.
- Developed **data migration strategies**, including data extraction, transformation, and loading (ETL) processes, to ensure a seamless transition.
- Created detailed documentation for **data migration procedures**, ensuring a smooth handover to support and operations teams.
- Designed and implemented a **data integration framework** to aggregate **claims data** from various sources, including healthcare providers and insured individuals.
- Developed **SQL queries** to extract, clean, and transform large volumes of **health insurance claims data** from diverse sources into a structured format for analysis.
- Developed **ad-hoc SQL reports and dashboards** to provide real-time insights into denial trends for prompt decision-making.
- Designed **SQL queries** to calculate and analyze the average cost of specific medical procedures, medications, or treatments, aiding in cost containment efforts.
- Ensured compliance with healthcare data privacy regulations (e.g., HIPAA) by implementing robust **SQL security measures**, access controls, and auditing mechanisms.
- Developed **dynamic visualizations** to display claim volume trends over time, highlighting seasonal patterns and anomalies.
- Created cost breakdown **charts and heatmaps** to identify cost drivers within the **claims data**, including providers, procedures, and diagnoses.
- Designed a provider scorecard using **Tableau** to assess the performance of healthcare providers based on factors like claim acceptance rate, denial rate, and reimbursement timelines.
- Developed anomaly detection models within **Tableau** to identify potentially fraudulent claims by analyzing patterns in **claims data**.
- Developed **SQL queries and scripts** to extract and transform raw health insurance claims data from multiple sources into a structured format for analysis.
- Utilized **SQL** to perform in-depth analysis of health insurance claims data, including claim frequency, cost distribution, and claim approval rates.
- Assessed the performance of healthcare providers within the network by analyzing claims data using **SQL**, identifying high-performing and cost-effective providers.
- Improved **SQL query performance** by optimizing queries, indexing tables, and fine-tuning database configurations, resulting in faster data retrieval and analysis.

Bio haven Health

New heaven, CT

Junior Business Analyst

Project Name: Disease Prevalence Mapping

Oct 2012- Jan 2016

- Led efforts to map disease prevalence using **geographic information systems (GIS) and healthcare data**, providing valuable insights into disease distribution and hotspots.
- Collected, cleaned, and validated **healthcare data** from diverse sources, ensuring data accuracy and consistency for disease prevalence analysis.
- Conducted **community-level health assessments** by mapping disease prevalence, helping local healthcare providers allocate resources and implement preventive measures.
- Improved **disease surveillance systems** by integrating disease prevalence mapping into routine monitoring, enabling early detection and response to disease outbreaks.
- Developed a comprehensive project plan following the **Waterfall SDLC**, outlining key milestones, deliverables, and timelines.
- Documented **detailed project requirements**, including the specific diseases or conditions to be mapped, geographic regions of interest, and data sources.
- Oversaw the development team's implementation of the disease prevalence mapping software, ensuring adherence to **Waterfall SDLC milestones**.
- Created **comprehensive documentation**, including user manuals and technical guides, to support system users and administrators.
- Collaborated with healthcare stakeholders to develop a comprehensive **Business Requirement Document** outlining the objectives, scope, and expected outcomes of the Disease Prevalence Mapping project.
- Ensured that **BRDs** included specific requirements for compliance with healthcare data privacy regulations, such as HIPAA, to protect patient data.
- Defined **functional requirements** for collecting, processing, and integrating diverse healthcare datasets, including patient demographics, diagnostic codes, and geographic coordinates.
- Defined **NFRs** for system scalability to handle increased data volumes as the project matures and attracts more users.
- Developed interactive disease prevalence maps using **Power BI** to visually represent the geographic distribution of specific diseases or health conditions.
- Designed and customized **Power BI dashboards** that allow users to filter and explore disease prevalence data by various demographic and clinical factors.
- Integrated **geographic information systems (GIS)** layers into **Power BI reports** to enhance the context of disease prevalence maps, improving their utility for public health planning.
- Created executive summaries within **Power BI reports** to highlight key disease prevalence findings and trends for high-level decision-makers.

Education

DePaul University

Chicago, IL
